Preface

This document describes the required configuration steps for the configuration of the feature Device@Home for System Devices. It also provides useful information regarding supported scenarios, known limitations and security considerations. The feature has been introduced with OpenScape Business V2R1 and has been enhanced with V2R2.

This description refers to OpenScape Business V2R2.

Deviating configuration hints for systems with SW version V2R1 are included in grey text boxes

Within the following the term “System Device” is used in general for all system clients, which support the HFA protocol such as OpenStage and Deskphone IP phones and also the VoIP client within the myPortal to go App.

1. Configuration Overview

The feature “Device@Home” has been released for System Devices and for myPortal to go apps with Voice over IP (VoIP) support from OpenScape Business V2R1 on. The feature offers registration and operation of System Devices, which are connected over the Internet as internal devices of OpenScape Business.

For all examples within the document, the following basic network scenario is used.

![Typical network environment](image)

Figure 1 Typical network environment

1.1. Network Scenario Description:

OpenScape Business is located within a company LAN, which is connected to the Internet via the Company Internet Router. This router is accessible from the Internet either via public IP Address 87.173.127.147 or via DNS name company.com.

The System Device@Home is connected to the LAN within a Home Network, which is connected to the Internet via a Home Internet Router. The Home Router is accessible from the Internet with the public Internet Address 87.173.125.178.

Within the Internet a STUN (Session Traversal Utilities for NAT) Server for public IP address discovery and an ITSP for Internet Telephone in general are available.
1.2. Configuration Steps

To connect the System Device@Home to OpenScape Business the following components need to be configured accordingly:

- OpenScape Business system within the company
- Company Internet Router
- System Devices @Home
- myPortal to go client (optional).

1.2.1. Overview OpenScape Business Configuration

In OpenScape Business the following configuration steps are required:

- Activate STUN support, if not already done for an ITSP, which is connected to OpenScape Business.
- Configure the number of “simultaneous Internet calls”. This value is implicitly set when the parameter “upstream up to (Kbps)” is set to a useful value in the basic installation wizard.
- Configure one System Client as externally connected client and assign an IP user license. This is also required if the myPortal to go VoIP option is used.
- Allow System Client registration from external (i.e. over the Internet) individually for each System Client by activating the integrated SBC function for that System Client (see 2.3).
- Enable Authentication and configure **STRONG, individual** passwords for the System (HFA) Device@Home, which is connected via Internet.

**V2R1:**

- Enable Authentication and configure **STRONG, individual** passwords for **ALL** System Clients regardless of their location (internal or external).

1.2.2. Overview Company Internet Router Configuration

As the System (HFA) Device@Home must reach the OpenScape Business system from the Internet and vice versa. The following configuration steps have to be done for the Company Internet Router:

- Configuration of a UDP port forwarding (see 3) for the RTP protocol port range.
- Configuration of a TCP port forwarding for the HFA protocol (when using System Devices).
- Optional: Configuration of a TCP port forwarding rule for HTTPS (only when using myPortal to go VoIP @Home).
- Optional: Configuration of a TCP port forwarding rule for the DLI service

**V2R1:**

- DLI is not supported. No port forwarding for DLI needs to be configured

**Note:**

If the company Internet router restricts outbound IP traffic, it may be necessary to explicitly open the ports also for outgoing IP traffic.

1.2.3. Overview System Device@Home Configuration

Within the System (HFA) Device@Home, following configuration steps have to be fulfilled:

- Configuration of the gateway IP address: Enter the public IP address (if fix) or public domain name of the OpenScape Business
- Configuration of the HFA password
- Optional for V2R2 and later: Configuration of DLS:

**V2R1:**

- DLI is not supported. Please leave the configuration field empty
1.3. Technical boundaries and limitations

1.3.1. Internet access of OpenScape Business

- Device@Home is tested and released for connection to the LAN2 interface of OpenScape Business. The WAN (LAN1) interface is not supported.
- ITSP trunks and System Device@Home have to be connected to the same LAN interface of OpenScape Business. Using different LAN interfaces, e.g. ITSP connected to the LAN 1 (WAN) and Device@Home connected via Internet to LAN 2, is not supported.

1.3.2. NAT configuration within Company and Home Router

Routers with NAT type "Symmetric NAT" are not compatible to the Device@Home solution. If the NAT behaviour is configurable in the router, it needs to be changed accordingly if possible.

Note:
The NAT type detection of the OpenScape Business (see Administration Portal) may falsely detect the NAT type of the Company router as "Symmetric NAT", if outbound IP traffic is restricted in the Company Internet router.

1.3.3. myPortal to go VoIP client:

- The VoIP client within the myPortal to go App required direct HTTPS access to TCP/8802 port within OpenScape Business.
- myPortal to go VoIP supports only G.711 codec.

1.3.4. Firmware Update of System Devices

For security reasons automatic firmware updates are not supported from remote. Before using a system device as Device@Home, it has to be connected once internally to the OpenScape Business in the company in order to perform a firmware update to the latest version, which is delivered with OpenScape Business V2R1 or later.

1.3.5. Desksharing Support

The feature System Device@Home, incl. myPortal to go VoIP client, is not released in combination with Deskshare mobility (relocate).

1.3.6. Capacities

OpenScape Business uses a so called "RTP proxy" for all VoIP connection via Internet. The RTP Proxy offers a shared pool with a limited amount of channels which are assigned to the Internet connections as follows:

- 1 RTP proxy channel per ITSP call
- 1 RTP proxy channel per Circuit call
- 1 RTP proxy channel per System Device @Home in a call
- 1 RTP proxy channel per SIP Device @Home in a call
- 1 RTP proxy channel per myPortal to go VoIP @Home in a call

Within the different OpenScape Business models following resources are available:

<table>
<thead>
<tr>
<th>System variant</th>
<th>RTP proxy channels</th>
</tr>
</thead>
<tbody>
<tr>
<td>OpenScape Business X1/X3/X5/X8</td>
<td>60</td>
</tr>
<tr>
<td>with or without Booster card/server</td>
<td></td>
</tr>
<tr>
<td>OpenScape Business S</td>
<td>180</td>
</tr>
</tbody>
</table>
2. OpenScape Business configuration

In general there are different scenarios to connect OpenScape Business system to the internet.

1. Behind an Internet Router connected to LAN2 interface
2. Behind an Internet Router connected to LAN 1 (WAN) interface
3. Behind an Broadband Modem connected to LAN1 (WAN) interface

Only scenario 1 is supported for device @home.
Scenario 2 and 3 cannot be used for connection of System Device@Home.

2.1. Supported Internet Access Scenarios for System Device@Home

The following scenarios are supported for connection of a System Device@Home via the Internet to OpenScape Business.

2.1.1. OpenScape Business behind access router connected to LAN2 interface

![Diagram](image_url)  
Figure 2: OpenScape Business behind access router connected to LAN2 interface

2.2. Configuring a System Client to be used from Internet

System Devices with HFA protocol are configured as System Clients within OpenScape Business Administration Portal (WBM). The general configuration of a System Client is described within the administration manual of OpenScape Business. In addition to the basic configuration the following settings in "Expert Mode" are necessary for System Device@Home.

The flag "Internet Registration with internal SBC" MUST be set for each System Client, which is connected via Internet.

The authentication has to be enabled for the external device and a strong authentication password has to be chosen before the SBC flag can be set. The password has to comply with the password policy of the Administration Portal, otherwise it is not accepted and guidelines are displayed.

V2R1:

In case that at least one System Client is configured for connection via Internet, the flag “Authentication” and strong, individual passwords have to be configured for ALL System Clients within OpenScape Business.)
In addition the Class of Service (COS) and System Flags should be reduced to the required needs for the System Clients in order to prevent toll fraud by dialing expensive premium or international numbers or by programming call forwarding to such numbers.

2.3. Configuring the number of simultaneous internet calls

Set the “Number of simultaneous internet calls” to a value bigger than zero. The value is implicitly set when the parameter “Upstream up to (Kbps)” is set to a useful value in the basic installation wizard.

2.4. Configuring STUN

The integrated Session Boarder Controller (SBC) function of OpenScape Business must be able to detect its public IP-address and -ports. This is done by using the STUN protocol.

In case that the system is already connected to an ITSP with activated STUN server, no additional configuration is required. The system is able to detect its public IP-address and port

In case that:

- OpenScape Business is connected to an ITSP with disabled STUN
- No ITSP is configured in the system

a STUN configuration is necessary within the system in order to determine its public IP address and port.
This STUN server configured in “Edit STUN Configuration” will be used only if no STUN server is configured for an ITSP.

2.5. Port configuration within OpenScape Business

The subsequent ports, which are used by OpenScape Business for signalling and voice payload transmission to externally connected System (HFA) Devices, must not be changed within the system configuration

2.5.1. Signalling Ports

<table>
<thead>
<tr>
<th>Protocol</th>
<th>Default port</th>
</tr>
</thead>
<tbody>
<tr>
<td>HFA (not encrypted)</td>
<td>TCP 4062 (for HFA phones)</td>
</tr>
<tr>
<td>HFA (encrypted)</td>
<td>TLS 4063 (for HFA phones)</td>
</tr>
<tr>
<td>HTTPS</td>
<td>TCP/8802 (for myPortal to go)</td>
</tr>
</tbody>
</table>

**V2R1:**

<table>
<thead>
<tr>
<th>Protocol</th>
<th>Default port</th>
</tr>
</thead>
<tbody>
<tr>
<td>HFA (not encrypted)</td>
<td>TCP/4060 (for HFA phones)</td>
</tr>
<tr>
<td>HTTPS</td>
<td>TCP/8802 (for myPortal to go)</td>
</tr>
</tbody>
</table>

2.5.2. Voice Payload Ports

For voice payload, the following port range is used:

<table>
<thead>
<tr>
<th>Protocol</th>
<th>Default port</th>
</tr>
</thead>
<tbody>
<tr>
<td>RTP</td>
<td>UDP/30274-30529 (for OpenScape Business X1/X3/X5/X8)</td>
</tr>
<tr>
<td></td>
<td>UDP/30528-30887 (for OpenScape Business S)</td>
</tr>
</tbody>
</table>
3. Company Internet Router Configuration

3.1. Port forwarding / firewall

The default configuration of the firewall within the Company Internet Router does not allow incoming VoIP traffic to the OpenScape Business system. Therefore the following port forwarding rules have to be defined within the router.

<table>
<thead>
<tr>
<th>Protocol</th>
<th>Internal Port in system</th>
<th>External port (Internet)</th>
</tr>
</thead>
<tbody>
<tr>
<td>HFA not encrypted</td>
<td>TCP/UDP 4062</td>
<td>TCP/UDP 4060</td>
</tr>
<tr>
<td>HFA encrypted</td>
<td>TCP/UDP 4063</td>
<td>TCP/UDP 4061</td>
</tr>
<tr>
<td>HTTPS</td>
<td>TCP/UDP 8802</td>
<td>TCP/UDP 8802 (only if myPortal to go is used)</td>
</tr>
<tr>
<td>DLI</td>
<td>TCP/UDP 18443</td>
<td>TCP/UDP 18443 (not supported in V2R1)</td>
</tr>
<tr>
<td>RTP</td>
<td>UDP/30274-30529</td>
<td>UDP/30274-30529 for OSBiz X</td>
</tr>
<tr>
<td></td>
<td>UDP/30528-30887</td>
<td>UDP/30528-30887 in OSBiz S</td>
</tr>
</tbody>
</table>

Note:

No gateway port adaptation is required within the System Device@Home, if using V2R2. All related settings are done within the company router.

3.2. Internet access with dynamic IP Address (DynDNS)

In case that the Internet Service Provider provides only a dynamic IP address (DynDNS) instead of a static IP address for the Internet connection of the company, appropriate means have to be taken into account to publish the current IP address of the company.

This can be achieved by using a dynamic DNS service like DynDNS. The Company Internet Router has to be configured with the dynamic DNS account data, which are supplied by the service provider.

Note:

- The port configuration has to be adapted also within the external device
- In case of system upgrade from V2R1 to V2R2 or later the port forwarding setting within the company router have to be changed to the default values for V2R2 or later. Otherwise the external system devices will not work.

V2R1:

<table>
<thead>
<tr>
<th>Protocol</th>
<th>Internal Port in system</th>
<th>External port (Internet)</th>
</tr>
</thead>
<tbody>
<tr>
<td>HFA</td>
<td>TCP/4060</td>
<td>TCP/4070 SHOULD be different from internal port in system</td>
</tr>
<tr>
<td>HTTPS</td>
<td>TCP/8802</td>
<td>TCP/8802</td>
</tr>
<tr>
<td>RTP</td>
<td>UDP/30274-30529</td>
<td>UDP/30274-30529 for OSBiz X; MUST be same range as in system!</td>
</tr>
<tr>
<td></td>
<td>UDP/30528-30887</td>
<td>UDP/30528-30887 in OSBiz S; MUST be same range as in system!</td>
</tr>
</tbody>
</table>

Note:

- The port configuration has to be adapted also within the external device
- In case of system upgrade from V2R1 to V2R2 or later the port forwarding setting within the company router have to be changed to the default values for V2R2 or later. Otherwise the external system devices will not work.
3.3. NAT type

The System Device@Home feature does not work in combination with company internet routers or home routers with NAT type “Symmetric NAT”.

The NAT type detection option within OpenScape Business can be used to determine the configured NAT type of the company internet router. If possible please change the NAT behavior of the router, in case that “Symmetric NAT” is detected by OpenScape Business.

Note: The NAT type detection of the OpenScape Business (may falsely detect the NAT type of the Company router as “Symmetric NAT” if outbound IP traffic is restricted in the Company router. Please make sure that the ports listed above are open in outbound direction as well.
4. System Device configuration

The feature System Device@Home is supported by the following devices and clients:

<table>
<thead>
<tr>
<th>Device / Client</th>
<th>Minimum software version</th>
</tr>
</thead>
<tbody>
<tr>
<td>OpenStage HFA</td>
<td>V3R0.33.1</td>
</tr>
<tr>
<td>Desk Phone IP HFA</td>
<td>V3R0.33.1</td>
</tr>
<tr>
<td>myPortal to go (Android) VoIP</td>
<td>V2R1.61.14</td>
</tr>
<tr>
<td>myPortal to go (iOS) VoIP</td>
<td>(coming soon...)</td>
</tr>
</tbody>
</table>

4.1. System Device Configuration

System
- Gateway
  - IP address either
    - Public IPv4 address of the OpenScape Business (if available via a fix IP address) or Public DNS name of the OpenScape Business.
  - Subscriber number / Identity
    - Internal phone number
  - Password
    - Password as configured for device authentication within OpenScape Business

Security
- System
  - Signalling transport main = TLS

Date and Time
- Source = System

Network
- Update Service DLS
  - Update Service / DLS: = public IP address of OSBiz [fix IP address]

V2R1:
  - Update Service / DLS: = None (leave the field empty)

4.2. myPortal to go VoIP Client configuration

User Account
- WAN server IP address = Public IP or DNS name of the OpenScape Business
- WAN server IP port = 8802 or other port according to the port forwarding in the Company Internet Router.

Optionally: User Account
- LAN server IP address = Internal IP address of OpenScape Business in your company WiFi
- LAN server IP port = 8802

More VoIP settings
- Enable “VoIP” flag
- Enable “Use VoIP in remote WiFi networks” flag

Note:
myPortal to go VoIP is only available in WiFi environments, but not via mobile data connections (3G/4G/...). A successful VoIP registration is shown in the status field of the VoIP settings menu.
5. Home Internet Router

Usually no specific configuration is necessary for the System Device@Home feature in the Home Internet Router. The router MUST comply with the following requirements:

- The Home router must provide VoIP enabled NAT (no symmetric NAT),
- The ALG function in the router must be deactivated, if available.

Note:

It has to be ensured that the Home Internet connection provides sufficient bandwidth for real time traffic. This applies especially for asymmetric DSL connections, which may have reduced upload bandwidth.
6. Security considerations

The System Device@Home feature is designed to be a cost effective option to connect home- and mobile worker etc. to OpenScape Business. It provides following security measures

<table>
<thead>
<tr>
<th>Client type</th>
<th>Security level</th>
</tr>
</thead>
<tbody>
<tr>
<td>System (HFA) Device@Home</td>
<td>- Access control by internal Session Border Controller (SBC)</td>
</tr>
<tr>
<td></td>
<td>- Device / User authentication secured by enforced password</td>
</tr>
<tr>
<td></td>
<td>- Signalling and payload encryption</td>
</tr>
<tr>
<td>myPortal to go @Home</td>
<td>- Authentication via encrypted UC password</td>
</tr>
<tr>
<td></td>
<td>- Signalling encryption via SSL (HTTPS)</td>
</tr>
<tr>
<td></td>
<td>- Payload encryption currently not supported.</td>
</tr>
</tbody>
</table>

The System Device@Home feature is not applicable for:

Environments with strict router/firewall policies where port forwarding from the internet are not allowed or symmetric NAT is in place

In this case, a VPN infrastructure between the central office and the home / mobile worker has to be considered.

Note:

It is recommended to use myPortal to go VoIP only in trusted WiFi environments (company, home office, ...).

V2R1:

The System Device@Home connection provides following security measures

<table>
<thead>
<tr>
<th>Client type</th>
<th>Security level</th>
</tr>
</thead>
<tbody>
<tr>
<td>Desk Phone @Home</td>
<td>- Authentication via HFA password</td>
</tr>
<tr>
<td></td>
<td>- Signalling and payload encryption currently not supported</td>
</tr>
<tr>
<td>myPortal to go @Home</td>
<td>- Authentication via encrypted UC password</td>
</tr>
<tr>
<td></td>
<td>- Signalling encryption via SSL (HTTPS)</td>
</tr>
<tr>
<td></td>
<td>- Payload encryption currently not supported.</td>
</tr>
</tbody>
</table>

It is recommended to use myPortal to go VoIP only in trusted WiFi environments (company, home office, ...).

The System Device@Home feature is not applicable for:

- Customers with security critical business / information in general
- Environments with strict router/firewall policies where port forwarding from the internet are not allowed or symmetric NAT is in place
- Customers with strict requirements regarding signaling and payload encryption

In these cases, a VPN infrastructure between the central office and the home / mobile worker has to be considered.)
7. Troubleshooting

In case of connection problems the following traces are needed. The numbers within the figure demonstrate which the physical location of the data which are traced.

1. Internal trace from OpenScape Business with the following Trace profiles activated:
   - Voice_Fax_connection
   - SIP_Interconnection_Subscriber_ITSP
   - Calls_with_System_Device_HFA
   - CSTA_applications (when using myPortal to go)
2. If myPortal to go is used please provide additionally:
   - Application trace from OpenScape Business
   - myPortal to go client trace via the feedback option in the app (currently only available with Android)
3. Wireshark trace capturing the traffic between the office router and the OpenScape Business system. This could be a TCP-dump from the router or a capture taken from the LAN
4. Wireshark trace from the remote location capturing the traffic between the affected HFA phone and the Home-/SOHO-Router. This could be a TCP-dump from the router (if supported) or a capture taken from the LAN
5. Information about Setup, e.g.
   - Used device (type and software release) at remote location
   - Used router at remote location
   - Used router at office location
   - List of IP addresses of all involved entities (HFA phone, smart phone, routers, OpenScape Business system)
